Integrating the Geospatial Workplace

Tie Status for Images

- **View / Fields** menu command for selecting visible fields in **Tie points** window
- Each image has a tie status – **Check** or **Approved**
- You can use **Define Color Corrections** to mark some images as approved (=you do not intend to collect a good number of tie points)
 - Link keyin command **tie set status a** to a function key
- Tie point report tells how many **Check** images do not have enough tie points
- **Search points** has **Skip approved images** so you can search tie points only in **Check images**

Integrating the Geospatial Workplace

Tie Point Improvements

- **View / Fields** menu command for selecting visible fields in **Tie points** window
- Four different sizes for **Tie points** window
- 'Average mismatch' field in images list in tie points window.
- 'Focus point list automatically' setting in 'Tie points / Automation' category. If on, TerraPhoto will keep keyboard focus in tie point list which makes it possible to use arrow keys to move between pixels.
- Delete keyboard key deletes selected tie point pixel
- **Display position hint** setting shows location or pixel ray of first pixel entered

14Feb2013 Terrasolid Workshop – ILMF 2013 – Denver, CO 3

Integrating the Geospatial Workplace

Various Improvements

- **Delete / By camera** command for image list
- **View / Sort images** can sort by image quality
- **Images / Delete / Outside ground** menu command for removing images which do not see any ground points

14Feb2013 Terrasolid Workshop – ILMF 2013 – Denver, CO 4

GeoCue Integrating the Geospatial Workplace

Various Improvements

- Support for using depth maps when extracting color for laser points from airborne images
- Builtin support for Swedish SWEREF 99 projection systems
- Color points use less memory than before
- **Filter bad** command for removing bad color points
- Compatibility with PowerCivil country versions 08.11.07.428 and 08.11.07.494

 Terrasolid

14Feb2013 Terrasolid Workshop – ILMF 2013 – Denver, CO 5

GeoCue Integrating the Geospatial Workplace

Export Orientation

- **Utility / Export orientation** menu command for writing exterior orientation into user defined file format using either HRP or OPK based rotation angles

Export Orientation

Camera: All cameras ▼

Output format: XYZ HRP Image ▼

Output angles: Degrees - 360 ▼

Rotation order: Heading pitch roll ▼

14Feb2013 Terrasolid Workshop – ILMF 2013 – Denver, CO 6

GeoCue Integrating the Geospatial Workplace

Edge Buffer in Rectification

- Avoid edges of building roofs to be rectified on ground

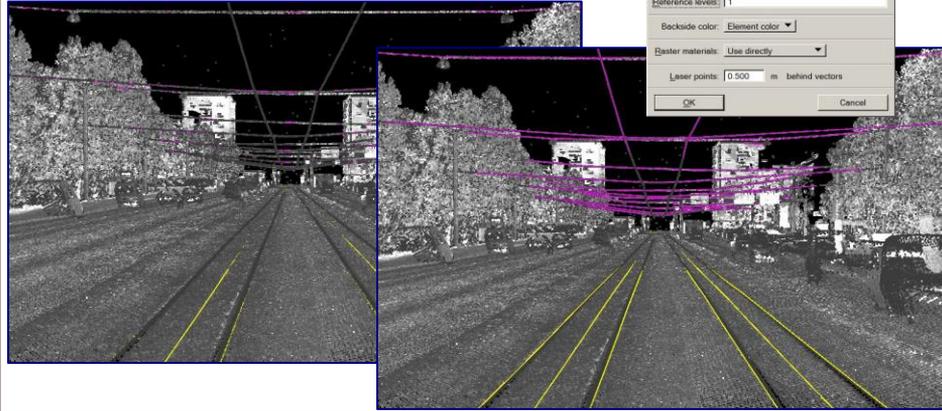

14Feb2013 Terrasolid Workshop – ILMF 2013 – Denver, CO 7

GeoCue Integrating the Geospatial Workplace

Vectors & Points in Rendering

- Laser points computed as more distant from viewer to force vectors to be visible

14Feb2013 Terrasolid Workshop – ILMF 2013 – Denver, CO 8

Integrating the Geospatial Workplace

XYZ Accuracy Estimates

- TerraPhoto now uses trajectory accuracy estimates
- For Applanix POS:
 - Use **File / Import files** first to read sbet_XXXX.out file
 - Use **File / Import accuracy files** to read smrmsg_XXX.out
- **Compute list** stores accuracy estimate for each image
- This will be stored in the image list file (.IML)
- Tie point calculation uses accuracy estimates to derive weight factors when solving location of common tie points

14Feb2013 Terrasolid Workshop – ILMF 2013 – Denver, CO 9

Integrating the Geospatial Workplace

Depth Point Tie Points

- For matching mobile drive passes to each other using observations from images
- Uses depth value from image depth map to translate manually entered image pixel into a full xyz observation
- Workflow:
 - Run **Compute depth maps** with **Close in time only** setting on to compute depth maps using laser data from the same drive pass only
 - Collect **Depth point** tie points
 - Use TerraMatch to solve and apply fluctuating xyz correction

14Feb2013 Terrasolid Workshop – ILMF 2013 – Denver, CO 10

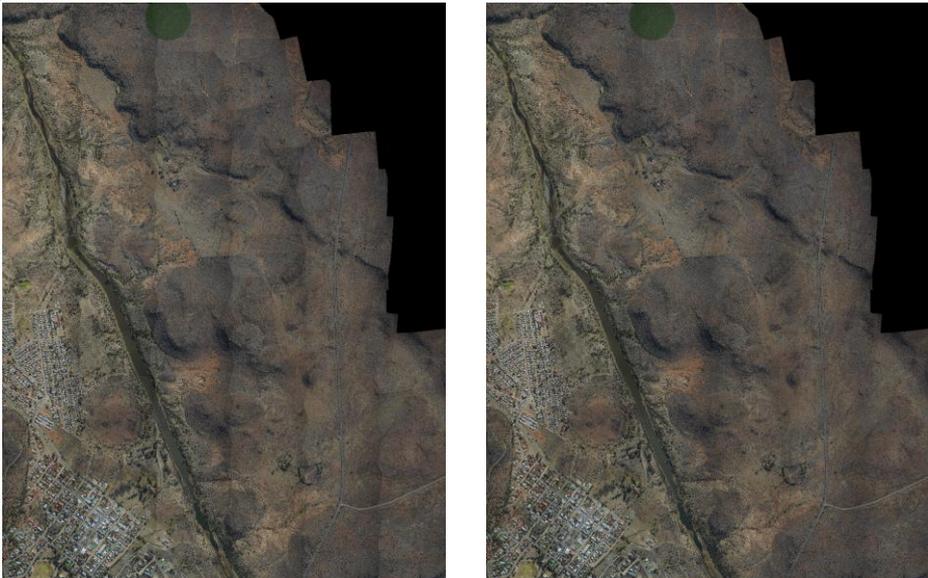

GeoCue Integrating the Geospatial Workplace

Tool/Derive Image Corrections

- Color points are observations of local brightness and coloring differences between images
- TerraPhoto has used color points to fix images locally to match other for ortho production
- Systematic effects such as sun hot spot have not been corrected – this may leave a striped pattern in the orthophoto when you zoom out
- **Utility / Assign groups** assigns images to groups based on sun direction
- Requirements:
 - Image time stamps are standard time → date
 - Mission definition has projection system → geographical location
- **Tool / Derive image corrections** solves a brightness distribution correction for each group

14Feb2013 Terrasolid Workshop – ILMF 2013 – Denver, CO 11

GeoCue Integrating the Geospatial Workplace

Raw ortho – no corrections *Local corrections from color points*

14Feb2013 Terrasolid Workshop – ILMF 2013 – Denver, CO 12

GeoCue Integrating the Geospatial Workplace

Sun Hot Spot

14Feb2013 Terrasolid Workshop – ILMF 2013 – Denver, CO 13

GeoCue Integrating the Geospatial Workplace

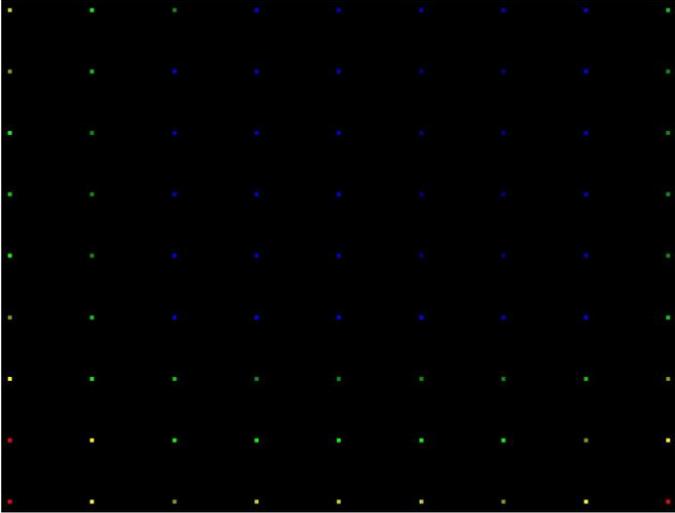

Sun Hot Spot Shape?

Brightness correction observations against image frame

14Feb2013 Terrasolid Workshop – ILMF 2013 – Denver, CO 14

GeoCue Integrating the Geospatial Workplace

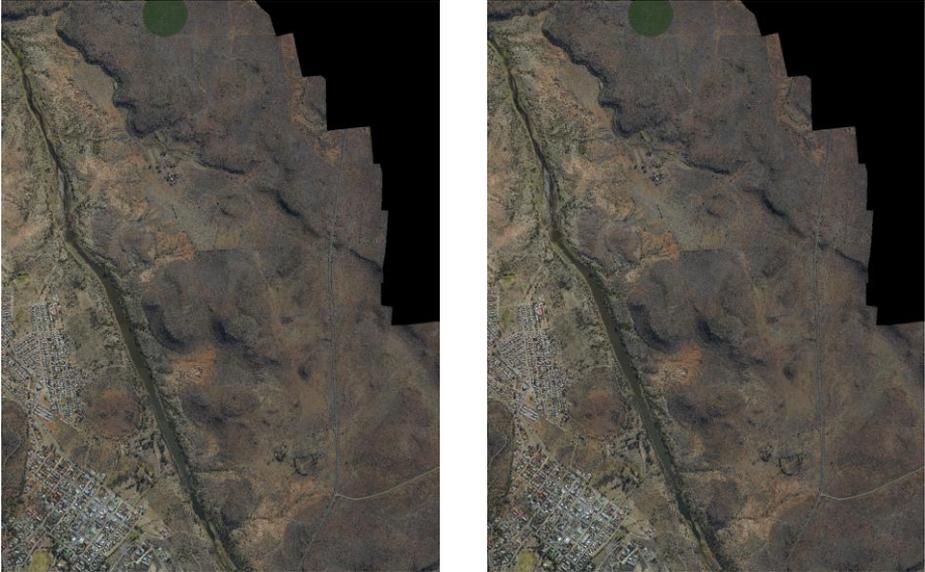

Grid Correction Model

Brightness correction grid derived from color point observations

14Feb2013 Terrasolid Workshop – ILMF 2013 – Denver, CO 15

GeoCue Integrating the Geospatial Workplace

Systematic image correction applied *Systematic and local corrections applied*

14Feb2013 Terrasolid Workshop – ILMF 2013 – Denver, CO 16
